Enbioment™

Questions and Answers

Who should use Enbioment™?

The Enbioment™ system was created for people suffering from various dermatological disorders due to imbalance or a deficit in the skin's microbiome. Individuals suffering from eczema, rosacea, skin fungus, psoriasis or atopic dermatitis are prime candidates for using Enbioment™ because these conditions are commonly associated with an imbalance in the skin's microbiome.

Will it help individuals with Acne?

The answer is YES, but only once the acute acne breakouts are under control. The reason for this is because our acne corrective products are highly anti-bacterial and will negate any positive effects the Enbioment™ system will produce. Therefore, the Enbioment™ system should only be prescribed to acne clients who can control their acne with DMK acne correctives, only during the day. They can then use the Enbioment™ system at night, at least 12 hours after using DMK acne correctives.

Are there products that should not be used with Enbioment™?

Enbioment™ is meant to be used with all DMK Home Prescriptives or with the finishing product in DMK Skin Revision™ Treatments. The only products that should NOT be used with Enbioment™ are:

- *Acne Wash*
- *Acu Wash*
- *BP 5% Lotion*
- *BP 10% Lotion*
- *Acu Klear*
- *Acu Mist*
- *Acu Masque*

The reason is that these products are specifically formulated to kill most bacteria which counteracts the purpose of the Enbioment™ system. *Acu Crème*, *Acu Moist* and *Actrol Powder* do not have enough anti-bacterial ingredients to negate the Enbioment™ system and can therefore be used in conjunction with the Enbioment™ system.

Can individuals without these conditions use Enbioment™?

YES, anyone who understands the importance of our microbiome in our skin health, can use Enbioment™ to help improve and maintain the health of their skin's microbiome.

How do you incorporate Enbioment™ products into your regular DMK Home Prescriptives regimen?

- Except for the Enbioment™ Cleanser, these products would be additional to other prescribed DMK Home Prescriptives, NOT replacements.
- Except for acne clients, anyone using the Enbioment™ system would use them as follows:
 1. Wash with Enbioment™ Cleanser, rinse and pat skin dry.
 2. If using DMK drops (*Melanotech Drops* or *Pore Reduction Plus*), you would apply these first and allow a few seconds for them to absorb into skin.
 3. Next, close eyes and spray a small amount of Enbioment™ Mist. Please note; unlike *Herb & Mineral*, you are not trying to get the skin wet.
 4. Apply a generous amount of Enbioment™ Serum over entire area being treated.
 5. Allow 30-60 seconds for Enbioment™ Serum to absorb before applying your other DMK products: Powders, Serums, Herb & Mineral, Oils, Nourishing Crème and Sunscreen.

Acne Clients

1. **Severe or highly active acne** clients should use their DMK acne correctives, both day and night until the acne is under control before beginning to use the Enbioment™ system.
2. **Mild to moderate acne** that is under control can benefit from Enbioment™. Clients should continue to use their DMK acne correctives during the day.

At night, they can use Enbioment™ as follows:

- Wash with Enbioment™ Cleanser, rinse and pat skin dry.
 - Next, close eyes and spray a small amount of Enbioment™ Mist.
- Please note that unlike *Herb & Mineral*, you are not trying to get the skin wet.
- Apply a generous amount of Enbioment™ Serum over entire area being treated.
 - Allow 30-60 seconds for Serum to absorb before applying *Actrol Powder*, *Acu Crème* or *Acu Moist*.

Can Enbioment™ products be used during DMK Skin Revision™ Treatments?

The answer is YES:

- Use Enbioment™ Cleanser as your cleanser.
- Do your normal pre-exfoliation and desincrustation (including *DMK Alkaline Wash*).
- Follow with *Enzyme Masque*.
- After removing the masque, the therapist applies any appropriate DMK drops and FibroMax C, then allows these products to absorb into the skin before continuing.
- Apply a small amount of Enbioment™ Mist, a light mist, not soaking.
- Apply liberal amount of Enbioment™ Serum. Let the Enbioment™ Serum settle onto the skin for at least 15 seconds. Please note: this does not create any type of

Enbioment™

occlusive film; additional products will continue to penetrate to the epidermis.

- Apply your other DMK Serums.
- Reestablish the acid mantle with *Herb & Mineral* and *Seba E*.
- Finally, apply your finishing crèmes and/or sunscreen.

Are there any contraindications or warnings?

The only precautions we would suggest is to avoid putting DMK Enbioment™ Serum on open wounds since it contains active bacterial spores. Also avoid getting all Enbioment™ products in eyes and rinse thoroughly if accidental contact. As is the DMK practice, if anyone has a negative or allergic reaction, they should discontinue using all their DMK products. They can then reintroduce them one at a time to see what product might be causing the reaction.

Post Alkaline weeping area?

Since weeping is considered an open wound, It is suggested to wait until the area crusts over or stops weeping. Instead, you can apply *Beta Gel* and *ContraDerm* to those areas.

Can Enbioment™ products be used day and night?

If the client is suffering from one of the conditions for which Enbioment™ is most indicted for: suffering from eczema, rosacea, skin fungus, psoriasis or atopic dermatitis, then using twice daily may be advantageous. Otherwise it is up to the discretion of the user.

Why is Enbioment™ Serum applied before FibroMax C and other DMK Serums?

You have all been taught to apply drops, then *FibroMax C* (if using) then serums, then spray, then finish with crèmes. FIRST, after cleansing: *Melanotech Drops*, *Fibromax C*, *Direct Delivery C*, *Beta Gel* etc. We apply drops first because they should absorb the deepest, we then apply Enbioment™ Serum because it sets up, distributes and maintains the skins microbiome film. As long as you allow the Enbioment™ Serum to settle into the skin, it will not act as a barrier, but more like a mesh that allows your other DMK products to penetrate. Just like your other serums, it will be locked in with the reestablishment of the acid mantle and will allow the nutrients of the nutritional crèmes to still penetrate.

Enbioment™

Can we treat viral skin conditions with Enbioment?

Enbioment™ is not intended to treat or cure any disease. It is designed to help reestablish health and diversity to the skin's microbiome. This is the microflora that humans host on the surface of our bodies. If our theories are correct, many visible skin conditions are caused or aggravated by an imbalanced microbiome, with a reestablished microbiome, reduction of many of the symptoms may be realized.

How is the Enbioment™ cleanser different from the other DMK cleansers?

First, Enbioment™ Cleanser was formulated with a gentle natural preservative system that causes less disruption to the skin's microbiome. Second it contains several prebiotics and postbiotics that help feed and maintain the microbiome. This helps the microflora to rebound quicker after each cleanse.

Are probiotics in all the Enbioment™ products?

NO, active probiotics are only in the Enbioment™ Serum. The Enbioment™ Cleanser and the Enbioment™ Mist contain prebiotics and postbiotics that enhance the existing microflora while providing a more optimal environment for the probiotic spores in the Enbioment™ Serum to activate.
